9.1.1 VOWELS IN A STRING

ALGORITHM

1. **Start**
2. **Input string s**
3. **Initialize count = 0**
4. **For each character in string**
5. **Check if character is vowel**
6. **If yes, increment count**
7. **Print count**
8. **End**

9.1.1. Count Vowels in a String - 1

00:34

Write a program that takes a string as input and prints the total count of vowels in that string. Consider both uppercase and lowercase.

Input Format:

- A single line contains a string that may contain letters, numbers, and punctuation.

Output Format:

- An integer representing the total number of vowels in the input string.

Sample Test Cases +

Debugger

```python
# Type Content here...
# Input
text = input()

# Define vowels
vowels = "aeiouAEIOU"

count = 0

# Count vowels
for char in text:
    if char in vowels:
        count += 1

# Output
print(count)
```

Average time 0.003 s 2.67 ms

Maximum time 0.004 s 4.00 ms

2 out of 2 shown test case(s) passed

4 out of 4 hidden test case(s) passed

Test case 1 4 ms Debug

Expected output	Actual output
Hello World!	Hello World!
3	3

Test case 2 3 ms

Terminal Test cases

9.1.2 PALINDROME OR NOT

ALGORITHM

1. **Start**
2. **Input string s**
3. **Reverse the string → rev = s[::-1]**
4. **Compare s with rev**
5. **If equal → Print "Palindrome"**
6. **Else → Print "Not a Palindrome"**
7. **End**

9.1.2: Palindrome or Not
00:39
Write a Python program to take a string as input and check whether the given string is a palindrome or not. A palindrome is a string that reads the same forwards and backward.
Input Format:
• A single line of input contains a string
Output Format:
• If the input string is a palindrome, print "Palindrome", otherwise print "Not a Palindrome"
Sample Test Cases
